

Periodontal disease and cardiovascular disease

Periodontal disease can affect your overall health. Over time, it may increase the risk for heart disease and stroke. Several studies have shown that people with periodontal disease may be more likely to have coronary artery disease than people with healthy mouths.

Right now, scientists have two possible explanations for this association. One is that the bacteria that cause periodontal disease can release toxins into or travel through the bloodstream and help to form fatty plaques in the arteries. These plaque deposits can lead to serious problems (i.e.: blood clots).

The other explanation is that these bacteria cause the liver to make high levels of certain proteins, which inflame the blood vessels. Inflammation eventually could lead to a heart attack or stroke.

Symptoms of periodontal disease include:

- Persistent bad breath
- Red, swollen or tender gums
- Gums that bleed when you brush your teeth
- Gums that have pulled away from the teeth
- Loose teeth
- A change in the way your teeth come together when you bite down

If you have symptoms of periodontal disease, see Dr. DeVitre for treatment. Our office number is (617) 236 5969.
